

## (USA/GB) Glitter Effect-tinting paste

Binder-free multi-purpose paste, with a high proportion of glitter-effect pigments for the effective enhancement of all types of wall paint.

For transparent types of coating, the addition of glitter is most effective. The particularly low weight of the glitter pigments causes to be suspended on the surface of the paint film. Due to this property, even colored wall paints can be enhanced with the addition of glitter.

MIXOL-Produkte Diebold GmbH, 73230 Kirchheim/Teck (Germany)

Attention: Percentage values in this shade card correspond to an added amount according to weight in an unpigmented coating (glazes) which was applied on a dark background.

Glittering effect may vary from sample in the shade card when using different coatings.

GE1 Gold (10%)

GE2 Silver (10%)

GE3 Multi (10%)

The recommended maximum doses to be added are: colourless coatings 10%, in some cases higher doses of up to 20% are possible with wall paints – however it should be tested in advance. Stir in using a stirring apparatus, if available.

Normal Glitter Effect-tinting pastes can be mixed into **water based wall paint** and/or **unpigmented/pigmented coating systems**, such as **glazes** (for wall, wood or cement) and **wood seals**.

To ensure the effect in the desired manner and to avoid any incompatibilities please make test in advance.

Pay attention when using matt glazes: when the paint has dried, the glittering effect can be enhanced by brushing the surface with a stiff brush.

Pay attention when using glossy glazes: the glitter pigments can lead to adhesion problems with the underground, so the glitter can be rubbed off by hand. Due to this, please test in advance that the glitter pigments are firmly bound in the paint.

Please note: when using white or colored pigment varnishes or lacquers, such pigments may hide the glitter flakes of the added glitter paste to impede the effect. Thus Glitter pastes cannot be generally used with every material.
