

Mica Powder

Mica powders are non-tarnishing and universal. They can be combined with virtually any medium and applied as a paint or glaze, creating a glowing metallic luster. Mica powders may be *flash gilded* by dusting over a water-based or oil-based gilding adhesive. Change the background color and mica powders take on different hues. Lessen the amount of powder in the medium, and the surface becomes translucent with an appearance of great depth. Below samples are flash gilded on white paper.
